results tab.

What is the query widget?

The query widget allows the user to search for, and export, details regarding a specified feature or nearby features. It is often used to generate a list of nearby parcels, for use by developers and municipal agencies, when working to satisfy public notification requirements.

- * You will be offered three spatial filters:
 - Only return features within current map extent
 - Return features within full extent of map
 - Only return features that intersect with the shape drawn on the map (steps above)
- If you choose A or B you are just about done! Just choose your filter and select “Apply”!
